

CAMPUS PLACEMENT & INTERNSHIP DRIVE 2026-27

Deep Tech | Robotics | Product Innovation | Advanced Manufacturing

Location: Bengaluru, Karnataka

About Evobi

Welcome to Evobi Automations Pvt. Ltd., a leading product innovation & automation company headquartered in Bengaluru. We operate at the intersection of deep engineering and transformative products through our two specialized business units:

Rednerds — therednerds.com

This is our Manufacturing Division, specializing in ODM (Original Design Manufacturing) and OEM (Original Equipment Manufacturing). Rednerds is where concepts become reality through high-quality design and production services. We help companies build their dream products here.

Yudu Robotics — yudurobotics.com

This is our product innovation engine. We design and develop cutting-edge hardware and software solutions with a core emphasis on Robotics and IoT. At Yudu, our goal is to integrate intelligent technology into transformative products, especially in the field of Education and beyond.

As an intern here, you're not just joining one company; you're stepping into a complete ecosystem.

You'll be at the heart of an organization that handles everything from foundational manufacturing to user-facing innovation.

This is a unique opportunity to see the full picture of how great technology is built, scaled, and delivered to the world.

We build products from first principles. We're looking for people who create the blueprint—not just execute someone else's.

We want thinkers who see the bigger picture, who question the 'why,' and who are obsessed with solving the deep, second-order problems that others haven't even thought of yet. If you're ready to take ownership, challenge assumptions, and build things that matter, you're in the right place.

Essential Instructions & Non-Negotiables: Read Carefully

We hire primarily based on demonstrated ability, technical depth, and evidence of real work. Confidence is valued, but skills are mandatory.

- **Solve, Don't Cite:** Your assessment will focus on live, on-the-spot problem-solving, algorithm challenges, and technical debugging. Citing past accomplishments, course completions, or distant academic accolades is irrelevant. We assess your ability to execute now.
- **Show Real Work (For Core Technical Roles), Not Certificates:** We require candidates to demonstrate their skills through functional projects, code quality, and hands-on deliverables. Certificates of completion, course completion awards, or theoretical certifications will not be considered during the assessment.
- **Code is Proof (core tech job):** All candidates must bring their projects ready for review on their laptop.

What to Carry (Logistics)

- **Hard Copy of Resume:** Bring 2 printed copies.
- **Carry a Pen with you.**
- **Laptops for Developers/Designers**

- Passport Size Photograph: Mandatory for candidates selected for Round 2 Interview. Please keep this ready.

Compensation & Growth

- Internship Stipend: ₹25,000 per month

We hire and reward for capability, execution speed, and ownership — not awards, college brand, or academic scores.

In addition to the stipend, interns may be eligible for project-based performance incentives for delivering high-quality work, taking ownership, and consistently meeting or exceeding expectations.

Performance incentives are discretionary and depend on ownership, execution quality, consistency, and contribution to project outcomes.

- Full-Time Opportunity: High-performing interns may be offered full-time roles upon successful completion of the internship.

Full-Time Compensation Structure

- Fixed Compensation: Up to ₹6 Lakhs per annum.
- Variable Compensation Extra: Performance-linked incentives based on role, responsibilities, project outcomes, and business impact.

For exceptional performers, performance-linked incentives can form a significant component of overall earnings and growth within the organization.

Open Internship Positions

1. Full Stack Developer Intern (AI Savvy)

We are looking for builders who can take a feature from idea to deployment — frontend, backend, database, APIs, and cloud infrastructure.

Mandatory Skills

- Strong React.js and Next.js development.
- Experience building and integrating REST and/or GraphQL APIs.
- Good understanding of databases (PostgreSQL preferred).
- Ability to design, build, debug, and deploy complete web applications.
- Familiarity with Docker, CI/CD pipelines, cloud deployment, and authentication/authorization systems.
- Strong problem-solving skills and the ability to quickly learn new technologies when required.

Mandatory Proof

Show us:

- A deployed web application you have built and maintained, AND/OR
- A GitHub repository demonstrating significant backend or full-stack development work.

Candidates must be prepared to run and explain their code during the interview and complete a short coding or debugging challenge.

Bonus Skills

- Rust development.
- Real-time systems and WebSockets.

- Dashboard and data visualization applications.
- Three.js, WebGL, browser-based simulations, or interactive 3D experiences.
- Game development, simulation engines, AR/VR projects.
- AI integrations, agentic workflows, and LLM-based applications.
- Performance optimization for large-scale web applications.

Please Do Not Apply If

- Your experience is limited to tutorials, clone projects, no-code tools, or assembling applications without understanding how the frontend, backend, and database work together.

We are looking for developers who can independently understand a problem, design a solution, build the complete stack, deploy it, and debug issues across the entire system.

2. Embedded Firmware Intern (AI Savvy)

We are looking for candidates who have built real embedded systems, not just assembled Arduino projects, for this role.

Mandatory Skills

- Strong C/C++ programming.
- Ability to read datasheets and write/debug device drivers (I2C, SPI, UART, PWM, ADC, CAN).
- Experience with STM32, TI, Microchip, Espressif, or similar platforms. Professional embedded firmware experience beyond Arduino IDE is expected.
- Strong hardware debugging skills.
- Ability to convert engineering concepts into detailed algorithms and working firmware.

Mandatory Proof

Show us:

- Driver code you have personally written (Display, Camera, Sensor, Communication Device, etc.), OR
- Bring your laptop and take us through the code (you should be able to edit and modify live if needed).

Bonus Skills

- Good understanding of robotics and motion control.
- AI agentic flows understanding.
- Edge AI vision, ROS skills.
- PID tuning (robots, drones, balancing systems, motor control).
- Kalman filters and sensor fusion.
- Inverse kinematics.
- Strong mathematical problem-solving and algorithm design.

Please Do Not Apply If

- Your experience is limited to **Arduino IDE projects**, library integrations, or tutorial-based projects without significant firmware development.

We are specifically looking for engineers who can understand a problem, design an algorithm, implement it in firmware, and debug it down to the hardware level.

3. Robotics Software Intern (ROS & Reinforcement Learning)

We're hiring fresh graduates and early-career engineers who are excited about humanoid robotics and want hands-on experience across the full sim-to-real pipeline — training locomotion policies in simulation, integrating them with ROS, and deploying them onto physical hardware.

The Role

Work directly with our robotics team on our compact humanoid platform: reinforcement learning experiments in MuJoCo, ROS nodes for control and telemetry, and closing the gap between simulation and the real robot. This is a learning-heavy role — we expect curiosity and strong fundamentals, not years of experience.

Mandatory Skills

- Strong Python fundamentals; working knowledge of C/C++.
- Exposure to ROS or ROS 2 (nodes, topics, launch files, URDF basics) through coursework, personal projects, or internships.
- Strong understanding of RL algorithms — MDPs, policy-gradient and actor-critic methods (PPO, SAC, CrossQ) — including reward shaping, exploration, replay buffers, and reading learning curves.
- Familiarity with at least one physics simulator — MuJoCo preferred; Gazebo, Isaac Gym/Lab, or PyBullet also considered.
- Comfortable in Linux with git and the command line.
- Solid grasp of basic robotics math: rigid-body transforms, rotations (quaternions/Euler), kinematics.

Mandatory Proof

Show us:

- A working RL training run (simulated locomotion, manipulation, or similar) with training curves/logs you can walk us through, AND/OR
- A GitHub repository with ROS/ROS 2 nodes or a URDF/MJCF model you've built or modified.

Candidates must be prepared to run and explain their code, and discuss reward design and debugging decisions live during the interview.

What You'll Work On

- Simulation & RL: training humanoid skills (get-up, standing, walking) in MuJoCo — CPU training (Gymnasium + Stable-Baselines3 PPO) and GPU-parallel training (MJX/JAX, thousands of environments); tuning reward functions, domain randomization, termination conditions under guidance.
- ROS integration: ROS 2 nodes for state publishing, joint command streaming, IMU/encoder logging, RViz visualization.
- Sim-to-real support: validating trained policies on hardware, comparing sim vs. real IMU/joint-angle traces, debugging observation mismatches, assisting with policy export (ONNX / C inference on ESP32-S3).
- Robot modeling: maintaining URDF/MJCF descriptions — joint limits, inertias, collision geometry, PD servo actuator models.
- Tooling: Python tools for TensorBoard plotting, policy rollout replay, benchmarking; documenting experiments for reproducibility.
- Participating in code reviews, daily standups, and hardware test sessions.

Bonus Skills

- Prior work with Isaac Gym/Lab or GPU-parallel RL pipelines.

- Experience with sim-to-real transfer specifically (not just simulation).
- Familiarity with ONNX export/embedded inference on microcontrollers.

Please Do Not Apply If

- Your RL experience is limited to following tutorials without understanding reward design, training dynamics, or how to debug a policy that isn't learning.
- You have no exposure to ROS/ROS 2 concepts at all.
- You're looking for a pure simulation role with no interest in eventually seeing it run on physical hardware.

4. Mechanical Design Engineering Intern

We're looking for someone who can take a rough idea and turn it into a manufacturable, tolerance-correct mechanical assembly — not just a visually appealing CAD model.

The Role

Design mechanical structures, enclosures, and moving assemblies for our robotics platforms — from concept sketch to production-ready part. You'll work across multiple product lines, translating functional requirements (motion, load, wiring, assembly) into real geometry that survives manufacturing, tolerancing, and field use.

Mandatory Skills

- Strong proficiency in Fusion 360 — parametric modeling, assemblies, joints/motion studies, and sheet metal.
- Ability to design complex structures and curved/organic surfaces for robotic platforms (chassis, limbs, housings, articulated joints).
- Solid understanding of GD&T and tolerance stacking — knowing what tolerance a part actually needs and why.
- Working knowledge of manufacturing processes relevant to DFM: injection molding (draft angles, wall thickness, ribs, gate/parting lines), sheet metal, 3D printing (FDM/SLA), and CNC machining.
- Ability to design for assembly (DFA) — fasteners, snap-fits, press-fits, service access.
- Comfortable producing manufacturing-ready drawings (dimensions, tolerances, surface finish, BOM).

Mandatory Proof

Show us:

- A CAD project (Fusion 360 preferred) you designed end-to-end — ideally something with moving parts, an enclosure, or a curved/complex surface — that you can open and modify live.
- A part or assembly you designed that was actually manufactured (3D printed, molded, machined, or sheet metal) with photos, if available.

Candidates must be prepared to walk through design decisions — why a wall thickness, a tolerance, a draft angle, a joint type — during the interview.

Bonus Skills

- Injection mold design / mold flow understanding (parting lines, ejector pins, shrinkage).
- FEA / simulation experience (stress, motion, thermal).
- Experience designing for robotics specifically — actuator mounts, gear trains, linkages, cable routing.
- Exposure to other CAD tools (SolidWorks, CATIA, Creo).
- Rapid prototyping mindset — iterating physical prototypes quickly rather than over-polishing a single CAD file.

Please Do Not Apply If

- Your CAD experience is limited to coursework assemblies or tutorial-based projects with no real manufacturing consideration.

- You can model geometry but don't understand why a tolerance, material, or process was chosen.
- You're looking for a pure rendering/visualization role with no interest in DFM or how the part actually gets made.

5. Product Validation Intern (Hardware & Software)

We are looking for students who enjoy breaking, testing, debugging, and improving products.

The Role

Evaluate robotics, electronics, and software products through structured testing. Identify issues, troubleshoot failures, document findings, and suggest product improvements.

Mandatory Skills

- Strong troubleshooting and debugging mindset.
- Ability to perform structured hardware and software testing.
- Good understanding of electronics, sensors, motors, and embedded systems.
- Ability to reproduce issues and document findings clearly.
- Attention to detail and systematic thinking.

Mandatory Proof

Show us:

- A test report, bug report, validation report, troubleshooting log, or similar work you have created.

Candidates must be prepared to inspect hardware, identify issues, and explain their debugging approach during the interview.

Bonus Skills

- Robotics project experience.
- Embedded systems knowledge.
- Automated testing tools.
- Hardware reliability and stress testing.
- Experience suggesting design or usability improvements.

Please Do Not Apply If

- You prefer only building things and have little interest in testing, debugging, troubleshooting, or finding faults.

We are looking for people who can systematically discover problems, identify root causes, and improve product quality.

6. Techno-Commercial (Business Development)Intern

The Role

This role is for candidates who enjoy working at the intersection of technology, business, and people. You will spend most of your time meeting business owners, partners, distributors, customers, and industry stakeholders to understand their challenges, identify opportunities, and help create solutions using technology. You will work closely with leadership on business development, partnerships, market expansion, customer discovery, trade fairs, and strategic growth initiatives.

This is not a desk job. Travel is a core part of the role.

You should enjoy understanding both technology and business equally.

Mandatory Requirements

- Decent understanding in Robotics, Automation, AI, Electronics, Embedded Systems, or Engineering-led products.
- Educational background or project experience in Robotics, Electronics, Mechatronics, Automation, Computer Science, AI, Mechanical Engineering, or related technical domains.
- Willingness to travel extensively and interact with customers, partners, and business owners.
- Ability to quickly understand technical concepts and communicate them clearly.
- Excellent Communication and Articulation skills

What We Look For

- Strong learning ability.
- Exceptional listening skills and the ability to identify underlying customer problems.
- Ability to simplify complex ideas and communicate them clearly.
- Strong observation, analytical thinking, and problem-solving ability.
- High ownership, execution speed, discipline, and resilience.
- Confidence interacting with business owners, founders, and senior decision-makers.
- Entrepreneurial mindset with a bias toward action.

Selection Process

Candidates should be prepared for discussion-based interviews, business scenarios, and problem-solving exercises designed to evaluate technical comprehension, learning speed, communication ability, business thinking, and ownership mindset.

Please Do Not Apply If

- You are looking for a purely technical engineering role.
- You are looking for a conventional sales role focused only on targets.
- You do not have an interest in robotics, automation, electronics, AI, or technology-driven products.
- You are uncomfortable with frequent travel and customer interactions.

We are looking for individuals who can understand technology, understand people, and convert that understanding into meaningful business opportunities.

What You'll Gain

- Work directly with the founding team and senior engineers.
- Build products shipped to real customers.
- Exposure across product design, firmware, software, manufacturing, and robotics.
- High ownership from Day 1.
- Opportunity to convert into a full-time engineering role.
